2016 Annual Drinking Water Quality Report City of Macon Water Department PWS#: 0520004 April 2017

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Dedrick Stevenson at 662-726-5251. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the second Tuesday of each month at 5:30 PM at the Macon City Hall located at 339 Pulaski Street.

Our water source is from wells drawing from the Utah Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the City of Macon have received moderate susceptibility rankings to contamination.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2016. In cases where monitoring wasn't required in 2016, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

			\mathbf{T}	EST RESUL'	TS			
Contaminant	Violation Y/N	Date Collected	Level Detected	Range of Detects or # of Samples Exceeding MCL/ACL	Unit Measure- ment	MCLG	MCL	Likely Source of Contamination
Inorganic	Contam	inants						
10. Barium	N	2016	.198	.1285198	ppm	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
13. Chromium	N	2016	2.4	1.4 – 2.4	ppb	100	100	Discharge from steel and pulp mills; erosion of natural deposits
14. Copper	N	2012/14*	.2	0	ppm	1.3	AL=1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
16. Fluoride**	N	2016	.963	.107 – .963	ppm	4	4	Erosion of natural deposits; water additive which promotes strong

									teeth; discharge from fertilizer and aluminum factories
17. Lead	N	2012/1	4* 2	0	ppb		0	AL=15	Corrosion of household plumbing systems, erosion of natural deposits
Disinfect	tion By-	Product	ts						
Disinfect	tion By-	Product 2016	ts	No Range	ppb	0			ly-Product of drinking water isinfection.

^{*} Most recent sample. No sample required for 2016.

As you can see by the table, our system had no contaminant violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some contaminants have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific contaminants on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. We did complete the monitoring requirements for bacteriological sampling that showed no coliform present. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the MACON ELECTRIC & WATER DEPT. is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.7-1.3 ppm was 4. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.7-1.3 ppm was 61%.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

We at the City of Macon Water Department work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

^{**} Fluoride level is routinely adjusted to the MS State Dept of Health's recommended level of 0.7 – 1.3 mg/l.

2016 Annual Drinking Water Quality Report Mashulaville Water District, Inc. PWS#: 0520005

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a sate and dependable supply of drinking water. We want you to understand the efforts we make to continuely improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Tuscalioosa Massive Sand Aquiller.

The source water assessment has been completed for our public water eyisem to determine the overall susceptibility of its driving.

weller supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility
characteristic by well to be a received product of the contamination of the product of the contamination of the contaminatio

If you have any questions about this report or concerning your water utility, please contact Anne B. Richardson at 882.494.8247 or 882.251.8826. We want our valued customers to be informed about their water utility. If you want to fearn more, please attend any of our regularly scheduled meetings. They are hald on the third Thursday of each month at 6.00 PM at 1882 Hill Road, Macon, MS 38341.

We routhery monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1th to December 31th, 2015. In cases where monitoring secent required in 2016, the table reflects the most recent results of the 2016 period in 2016, the table reflects the most recent results do see that the contaminants and can pack up substances or contaminants from the presence of amonal or from human actifying recorded contaminants. Such as winess and bedetrie, thin may come from every teatment plants, septic systems, agricultural livestock operations, and widther inorganic contaminants, such as sets and metals, which can be naturally occurring or nearly from urban somewhere inducency so of any operations, and widther inorganic contaminants, such as sets and metals, which can be naturally occurring or nearly from urban somewhere inducency so of any operations, and whether any other humans are such as a set and metals, which can be naturally occurring or nearly from urban somewhere inducency so of any operation and including synthetic and volation organic chemicals, which can be naturally occurring or nearly contaminants, which can be naturally occurring or nearly of the result of old and gas production and mining activities in order to ensure that tay world or industrial processes and petroleum production, and can also come from gas stations and septic systems; rediscribe contaminants, which can be naturally occurring or be the result of old and gas production and mining activities in order to ensure that tay were as all drinking water. In a support of these consistency of these consistency to do not necessarily indicate that the water posses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions.

Action Level - the concentration of a contaminant-which, it exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Conteminent Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a conteminant that is allowed in drinking water. MCLs are set as close to the MCLGs as fessible using the best available treatment technology.

Maximum Convarianant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminent in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of sofety

Millunsum Residual Disinfection Lovel (MRDL) — The highest level of a disinfection allowed in difinking water. There is convincing evidence that addition of a disinfection is necessary to control microbial contempnants.

Maximum Residuel Deschotest Level Goal (MRDLG) - The level of a dinking water disunfactant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants

Paris per million (ppm) or Mikigrams per kier (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parté per billion (µpp) or Necrograma por filer : one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.
